MICROBIX

INTRODUCTION

Serological tests are a valuable diagnostic methodology for evaluating SARS-CoV-2 post-infection immunity. Specifically, they are a useful tool for monitoring the seroconversion associated with convalescence or vaccination and can help identify the possible need for re-vaccination within a given timeframe.

Currently used convalescent patient plasma pools and humanized mouse monoclonal antibody formulations are not reliable for use as Quality Control (QC) or External Quality Assessment (EQA) samples, due to their poor repeatability, cross-reactivity, and lack of linearity. There is a pressing need for reliable QC and EQA materials that cover the diverse SARS-CoV-2 Serological IVD ecosystem.

AIM

To develop and demonstrate the performance of anti-S1 human monoclonal antibody formulated in a plasma-like matrix. The material has been benchmarked against the WHO reference material (NIBSC code:20/136), permitting the standardization of various serological assays and systems. The formulation is non-infectious, non-cross-reactive, and highly repeatable.

MATERIALS & METHODS

Microbix's panel of serological samples is comprised of seven different levels of neutralizing anti-S1 SARS-CoV-2 human monoclonal antibody (hMAb) in a proprietary human plasma-like matrix. The performance of the anti-S1 SARS-CoV-2 hMAb levels was evaluated using the Anti-SARS-CoV-2 QuantiVac ELISA (IgG) (Euroimmun) benchmarked against the NIBSC code:20/136 standard and the Elecsys ACOV2 / ACOV2 S (Roche) (Table 1 and 2). Three levels representing high (H), medium (M) and low (L) levels were selected for additional feasibility studies by clinical laboratories (1WA, OASYS Table. 3) and were confirmed internally by serological rapid test POCT detection methodologies.

Product Name	Cat#	Level
PROCEEDx™ anti-SARS-CoV-2 Ab Positive Sample L1	VP-19-19L1	H
PROCEEDx™ anti-SARS-CoV-2 Ab Positive Sample L2	VP-19-19L2	H
PROCEEDx™ anti-SARS-CoV-2 Ab Positive Sample L3	**VP-19-19L3**	**H**
PROCEEDx™ anti-SARS-CoV-2 Ab Positive Sample L4	VP-19-19L4	M
PROCEEDx™ anti-SARS-CoV-2 Ab Positive Sample L5	**VP-19-19L5**	**M**
PROCEEDx™ anti-SARS-CoV-2 Ab Positive Sample L6	VP-19-19L6	L
PROCEEDx™ anti-SARS-CoV-2 Ab Positive Sample L7	**VP-19-19L7**	**L**

Summary of Anti-S1 SARS-CoV-2 IgG Pilot Study S-protein based tests - detectability

2 Participants / 2 Countries	18 Number of Responses / 2 Participating Assays	100% Success Rate for H Sample (L3)	100% Success Rate for M Sample (L5)	50% Success Rate for L Sample (L7)

Summary of Anti-S1 SARS-CoV-2 IgG Pilot Study N-protein based test – specificity

1 Participant / 1 Country	9 Number of Responses / 1 Participating Assay	100% Success Rate for H Sample (L3)	100% Success Rate for M Sample (L5)	100% Success Rate for L Sample (L7)

[2] GenScript cPass™ SARS-CoV-2 Neutralization Antibody Detection Kit is a blocking immunoassay designed for qualitative direct detection of total neutralizing antibodies to SARS-CoV-2 in human serum and K2-EDTA plasma. The assay is designed to detect protecting levels of neutralizing antibodies. Negative result refers to < 30% Signal Inhibition and therefore low level of neutralizing antibodies will be considered negative result.

CONCLUSIONS

The novel anti-S1 SARS-CoV-2 hMAb formulations showed excellent linearity when evaluated with the Anti-SARS-CoV-2 QuantiVac ELISA (IgG) and Elecsys ACOV2. Additionally, their successful detection across testing platforms and methodologies demonstrates that these formulations are cross-platform compatible and have the potential to be used for benchmarking the performance of current tests. Although, notably, the numerical BAU/mL values differed between assays, which can be explained by differences in the use of antigens and applied testing methods. Lastly, the anti-S1 SARS-CoV-2 hMAb formulations can be used as prospective cross-platform EQA samples and quality controls for emerging SARS-CoV-2 IgG quantification tests designed to monitor vaccination efficacy.
